SCIENTIFIC PATHOLOGIST INVESTIGATOR CALLS GREENPATCH “THE PRODUCT OF THE FUTURE”

Among his many scientific and environmental achievements, Marine Biologist and Disease Pathologist Dr. James Cervino, PhD. has investigated and testified against land fills and asphalt plants in the wetlands of New York City for recklessly dispersing volumes of carcinogenic substances and environmental toxins into our shores and ground water. But while performing a thorough review of GREENPATCH by Cold Mix Manufacturing, he not only applauds the product for its use of non-hazardous plant oils and the absence of VOC's (volatile organic compounds) in its ingredients- but also commends and supports Dario Amicucci and Glenn Shapiro, the producers of this “ingenious product” for their ethical and conscientious business model.

Storm water and wind is one of the leading vehicles for circulating toxins from road materials into public exposure. Cervino has dedicated his career as a marine pathologist and a molecular biologist investigating the effects of our changing planet- and the many health issues associated with the terrifying results of harmful man-made toxins released into our soil and water. Following intense rains, deadly compounds from conventional asphalt are reactivated and mobilized— the same compounds that are directly linked with pancreatic cancer, renal failure and respiratory & neurodegenerative diseases

On a political frame, Dr Cervino believes the change is vital, yet a struggle to get accepted on a legislative level. “It’s the people that don’t want change that are blocking products like GreenPatch from being a standard... and used all over the planet (or at least) all over the 5 boroughs”, states Cervino. “If we did, you will see an immediate reduction in one year in the number of respiratory ailments; such as Asthma and cancer over the long term and in the number cancer cases and respiratory infections in our area”.
